

RDBMS Databases by nature requires huge computing capacity/system resources in running because:

1. The support filtering
2. data computation
3. joining the data

as these are resource intensive systems, always they need high-end server grade machines to run on.

Bough a computer:

1. 1 TB Hdd
2. 32core processor

10 lacs = amount

1 TB = 600GB = objects (INSERT, UPDATE, DELETE, FETCH) (TRASH)
400GB = text

Object storage databases (cpu/memory: low): Comodity hardware computers = 1TB, 8core = 35000/
|-FileSystem (based)
