

how many objects of the SessionFactory should be created within the Hibernate Application?

Within an Hibernate Application we should create 1 SessionFactory per 1 database of the application.  
 which means if we are using 2 databases in our application then we need 2 SessionFactory objects  
 1 holding configuration/mapping and connection pool to the 1st database  
 2nd holding configuration/mapping and connection pool to the 2nd database

using which we can create respective Session objects to perform operation on the underlying database tables
